## CHALLENGE

By analyzing our equipment database, Hunton Services was able to identify potential refurbishment needs for four cooling towers at an international oilfield services company headquartered in Houston, TX. After consulting with the customer, we found that the towers on site were experiencing reduced efficiency, worn out parts and components, and required new fill media.

## SOLUTION

Our dedicated, in-house team of cooling tower experts executed successful rebuilds of all four cooling towers by installing new, updated fill media in each one. The drift eliminators and louvers in all four towers were also replaced with new [Evapco](#) parts.

## RESULTS

According to the customer, performance of all four cooling towers has improved since the job was completed. Our solution increased the overall performance, efficiency, capacity, and life cycle of the equipment. The entire job was completed in six days.

*“Overall the guys did a good job. They kept everything clean, organized, and met our timeline. We worked with them to get everything unloaded safely without any hazards. The work area was left clean and well organized when the job was complete. The Hunton Services team met all of our expectations regarding performance and professionalism. We had one small hiccup after the job and the technician came right back and assisted us in getting everything up and running without any downtime.”*
